Hands On Digital Signal Processing

The most common processing approach in the time or space domain is enhancement of the input signal through a method called filtering. Digital filtering generally consists of some linear transformation of a number of surrounding samples around the current sample of the input or output signal. There are various ways to characterize filters; for example:

Today's internet, accessed by fixed and mobile networks, allows us to transmit files, voice and video across the planet. With the emergence of an ultra-responsive and reliable 'Tactile Internet,' advanced techniques in robotics and artificial intelligence, we predict the emergence of an 'Internet of Skills' which allows the transmission of labor globally.
