

## *Hysteretic Behavior Of Reinforced Concrete Columns Subjected To High Axial*

### **Hysteretic Behavior Of Reinforced Concrete**

Developed and Implemented by: Kristijan Kolozvari, California State University, Fullerton . Kutay Orakcal, Bogazici University, Istanbul, Turkey . John Wallace, Univeristy of California, Los Angeles . This command is used to construct a uniaxialMaterial ConcreteCM (Kolozvari et al., 2015), which is a uniaxial hysteretic constitutive model for concrete developed by Chang and Mander (1994).

DISCUSSION: The concrete material, Concrete06 (Fig. 2), keeps the simplicity of previous formulations (Concrete01 to Concrete03). However, envelope curves have been modified to represent concrete behavior in membrane elements.

Call for Abstracts and Special Sessions . EASEC-16 will provide an excellent forum for participants from around the world to review, discuss and present the latest developments in the broad discipline of structural engineering and construction.

The optimum slip maximizes energy absorption for a given frame configuration and a given lateral force. It has been found that this force is below 50% of the story shear but different forces are often selected by the structural designer depending on his/her constraints and objectives.

In concrete or masonry structures, shear is resisted as diagonal tension. When Fiber Reinforced Polymer (FRP) is bonded to the URM wall with fibers aligned in horizontal and vertical directions, a shear crack cannot cause failure until all fibers crossing that crack fail in tension.

Shake table tests on a non-seismically detailed RC frame structure Akanshu Sharma, G.R. Reddy and K.K. Vaze Abstract; Full Text (3127K) Abstract A reinforced concrete (RC) framed structure detailed according to non-seismic detailing provisions as per Indian Standard was tested on shake table under dynamic loads.

Earthquake engineering is an interdisciplinary branch of engineering that designs and analyzes structures, such as buildings and bridges, with earthquakes in mind. Its overall goal is to make such structures more resistant to earthquakes. An earthquake (or seismic) engineer aims to construct structures that will not be damaged in minor shaking and will avoid serious damage or collapse in a ...

The goal of the overall project described in this paper is to investigate the system level performance of concentrically braced buildings subjected to seismic loads with the intention of understanding the structural and ground motion characteristics that control their behavior, and to assess and, where necessary, propose improved design and analysis procedures.
